

WSGI ==> Web Server Gateway Interface

AWS EC2

Azure

Apache

WSGI

```
from flask import Flask
```

It creates an instance of the Flask class,
Which will be your WSGI(Web Server Gateway
Interface)

```
app=Flask(__name__) --> entry point of your  
web app
```

```
@app.route('/') -- this is routing - like pages on  
websites
```

```
def welcome():
```

```
    return "Welcome to my flask course this is  
the best way you can learn. This should be an  
amazing course."
```

```
if __name__ == "__main__":  
    app.run(debug=True) --- this line will active
```

debugger mode means you will be able to see the changes in development mode-- but the thing is when you write **debug=True** you need to restart the server once.
